To whom it may concern

We have performed biodegradability tests on a selection of our paper qualities at the Swedish Technical Research Institute of Sweden according to ISO 14855-1:2005. One of our base qualities with wet strength agent and silicone added were tested.

According to the results from these tests both qualities are totally biodegradable. Therefore, these results can apply for the entire product range of Nordic Paper and the papers can be considered to be completely biodegradable.

The tested sample was degraded to 92% after 125 days. The requirements according to A.2.2.2 in EN 13432 states that at least 90% of the material shall be biodegraded within 6 months (180 days).

According to our knowledge of our raw materials are added in our manufacturing process and knowing of analysis results of heavy metals of our products, we deem that we will fulfil the demands in EN 13432 standard, which show our paper products also are compostable.

According to our knowledge our greaseproof products are recyclable. In our paper production, we repulp side runs ("pre-consumer") and waste from our paper machines.
